Acknowledgments

This project is the collaborative effort of the 30 research teams involving 34 different research organizations, as well as the National Conference of Black Political Scientists (NCOBPS). Individual teams had their own principal investigators and research groups and designed their own team surveys. The teams and their Principal Investigators are:

Referencing the Study

For research that uses the Common Content, the reference follows the ICPSR protocol:

Ansolabehere, Stephen, COOPERATIVE CONGRESSIONAL ELECTION STUDY, 2012: COMMON CONTENT. [Computer File] Release 1: April 15, 2013. Cambridge, MA: Harvard University [producer] http://cces.gov.harvard.edu

As individual teams use their datasets for publication and make their datasets available, referencing the team content will follow the same protocol:

[Name of Team Principal Investigator], COOPERATIVE CONGRESSIONAL ELECTION STUDY, 2012: [TEAM NAME] CONTENT. [Computer File] Release: [Date]. [Location of Team]. [producer] http://cces.gov.harvard.edu

Part I

Introduction

The Cooperative Congressional Election Study, or CCES, seeks to study how Americans view Congress and hold their representatives accountable during elections, how they voted and their electoral experiences, and how their behavior and experiences vary with political geography and social context. This study constructed a very large sample capable of capturing variation across a wide variety of legislative constituencies. In fact, the state-level samples are sufficiently large as to measure with a reasonable degree of precision the distribution of voters' preferences within most states.

The 2012 CCES involved 48 teams, yielding a Common Content sample of 54,535 cases. The subjects for this sutdy were recruited during the fall of 2012. Each research team purchased a 1,000 person national sample survey, conducted in October and November of 2012 by YouGov/Polimetrix of Palo Alto, CA. Each survey has approximately 120 questions. For each survey of 1,000 persons, half of the questionnaire was developed and controlled entirely by each individual research team, and half of the questionnaire is devoted to Common Content. The Common Content consists of the questions common to all team modules and has a sample size equal to the total sample size of all team modules combined. Most of the 30 teams purchased 1,000 person surveys, thought the Harvard/MIT team purchased additional cases to increase their sample size and size of the Common Content. All cases were selected through the Internet and YouGov/Polimetrix constructed matched random samples for this study.

Interviews for the 2012 survey were conducted in two waves. The Pre-Election wave was conducted during October, 2012, and gagued issue preferences, knowledge of the candidates, some demographics, and vote intentions. The Post-Election wave was conducted the two weeks following Election Day (November 6, 2012). Data Release 1 occurred on March 11, 2013. Data for this study is archived and available at the Harvard University Dataverse Project.

The 2012 CCES is part of an on-going study. The Cooperative Congressional Election Study formed in 2006 to study congressional elections and representation using very large scale national surveys, building off of the 2005 MIT Public Opinion Research and Training Lab (PORTL) study. Thirty-six separate teams joined the consortium for the 2006 study. The 2006 Common Content amounted to a 36,500 person survey that allowed the collaborative to measure the distribution of political attitudes and preferences within states and congressional districts. A smaller group assembled to conduct a 10,000 person survey in 2007, and was conducted during the last two weeks of November, 2007. The 2007 study consisted of reinterviews of subjects from the 2006 study. In 2008, the collaborative again conducted a large-scale study with 32,800 cases. A separate, 2,000 respondent panel study was conducted by Stephen Ansolabehere, and consisted of interviews of the same people in 2006, 2007, and 2008. The 2009 off-year study employed a smaller, 13,800 respondent sample.

This guide describes the methodology behind the overall study and the measures and variables developed for the Common Content of the 2012 study. There are five parts to the 2012 CCES Common Content – sample identifiers (including state and congressional district), profile questions (largely demographic), pre-election questions, post-election questions, and contextual data (including candidate names and parties, election results, and roll call votes). This codebook provides question wordings, values, and frequencies presented of the variables for the 2012 Common Content dataset. Each Team Module has its own dataset and codebook, distributed by the team at its discretion. However, in the spirit of openness it is strongly recommended that all teams make their data available to the public for free.

The criteria for inclusion of a question in the Common Content were three-fold. First, what questions would naturally be of interest to scholars researching Congress, representation, and elections? Items such as approval of Congress, approval of the individual Senator or House Member, Partisanship, Ideology, views on the economy and war, and Voting Behavior, as well as demographic characteristics of voters fall into this category. Second, what questions did a large number of teams want to include in the study? For example, a number of research teams expressed interests in studying roll call voting behavior of members of Congress. Another cluster of teams wanted a more extensive battery of questions of religion, which led the CCES to expand beyond the usual questions asked by the ANES. Third, what phenomena can only be measured with a large survey? The very large sample for the Common Content provides the opportunity to study legislative constituencies – states and congressional districts – as well as voters within those constituencies, to study very rare or low frequency events or very small populations, and to measure with fairly high accuracy interactions. An example of content included in the common for this reason is the battery of questions on problems encountered when voting. Such problems occur at the frequency of about 2 or 3 percent, are enough to present voting rights issues, but too small to be measured in standard surveys.

Each individual research group also produced their own Team Content. That content was controlled by the specific group and is distributed through that group. Some of the individual teams distribute their 1,000 respondent surveys through the CCES collaborative. Separate codebooks and databases are prepared by the individual teams.

Part II

Sampling Methodology

The 2012 CCES survey was conducted over the Internet by YouGov/ Polimetrix. The Common Content was asked of 54,535 adults interviewed in October 2012 (for pre-election data), and in November 2012 (for post-election data). The sampling method uses YouGov/Polimetrixs matched random sample methodology. A Pew-sponsored research project run by the Caltech/MIT Voting Technology Project conducted a split sample study contrasting this methodology with random digit dialing phone methods during the 2008 general election. Interested researchers are encouraged to contact Charles Stewart at MIT for further details on that comparison of sampling methodologies. Overall, the differences between the two sorts of samples were slight.

Sampling and sample matching

Sample matching is a methodology for selection of "representative" samples from non-randomly selected pools of respondents. It is ideally suited for Web access panels, but could also be used for other types of surveys, such as phone surveys. Sample matching starts with an enumeration of the *target population*. For general population studies, the target population is all adults, and can be enumerated through the use of the decennial Census or a high quality survey, such as the American Community Survey. In other contexts, this is known as the *sampling frame*, though, unlike conventional sampling, the sample is *not* drawn from the frame. Traditional sampling, then, selects individuals from the sampling frame at random for participation in the study. This may not be feasible or economical as the contact information, especially email addresses, is not available for all individuals in the frame and refusals to participate increase the costs of sampling in this way.

Sample selection using the matching methodology is a two-stage process. First, a random sample is drawn from the target population. We call this sample the *target sample*. Details on how the target sample is drawn are provided below, but the essential idea is that this sample is a true probability sample and thus representative of the frame from which it was drawn.

Second, for each member of the target sample, we select one or more *matching* members from our pool of opt-in respondents. This is called the *matched sample*. Matching is accomplished using a large set of variables that are available in consumer and voter databases for both the target population and the opt-in panel.

The purpose of matching is to find an available respondent who is as similar as possible to the selected member of the target sample. The result is a sample of respondents who have the same measured characteristics as the target sample. Under certain conditions, described below, the matched sample will have similar properties to a true random sample. That is,

the matched sample mimics the characteristics of the target sample. It is, as far as we can tell, "representative" of the target population (because it is similar to the target sample).

When choosing the matched sample, it is necessary to find the closest matching respondent in the panel of opt-ins to each member of the target sample. Various types of matching could be employed: exact matching, propensity score matching, and proximity matching. Exact matching is impossible if the set of characteristics used for matching is large and, even for a small set of characteristics, requires a very large panel (to find an exact match). Propensity score matching has the disadvantage of requiring estimation of the propensity score. Either a propensity score needs to be estimated for each individual study, so the procedure is automatic, or a single propensity score must be estimated for all studies. If large numbers of variables are used the estimated propensity scores can become unstable and lead to poor samples.

YouGov/Polimetrix employs the proximity matching method. For each variable used for matching, we define a *distance function*, d(x,y), which describes how "close" the values x and y are on a particular attribute. The overall distance between a member of the target sample and a member of the panel is a weighted sum of the individual distance functions on each attribute. The weights can be adjusted for each study based upon which variables are thought to be important for that study, though, for the most part, we have not found the matching procedure to be sensitive to small adjustments of the weights. A large weight, on the other hand, forces the algorithm toward an exact match on that dimension.

Theoretical backgroud for sample matching

To understand better the sample matching methodology, it may be helpful to think of the target sample as a simple random sample (SRS) from the target population. The SRS yields unbiased estimates because the selection mechanism is unrelated to particular characteristics of the population. The efficiency of the SRS can be improved by using stratified sampling in place of simple random sampling. SRS is generally less efficient than stratified sampling because the size of population subgroups varies in the target sample.

Stratified random sampling partitions the population into a set of categories that are believed to be more homogeneous than the overall population, called *strata*. For example, we might divide the population into race, age, and gender categories. The cross-classification of these three attributes divides the overall population into a set of mutually exclusive and exhaustive groups or strata. Then an SRS is drawn from each category and the combined set of respondents constitutes a stratified sample. If the number of respondents selected in each strata is proportional to their frequency in the target population, then the sample is self-representing and requires no additional weighting.

The intuition behind sample matching is analogous to stratified sampling: if respondents who are similar on a large number of characteristics tend to be similar on other items for which we lack data, then substituting one for the other should have little impact upon the sample. This intuition can be made rigorous under certain assumptions.

Assumption 1: Ignorability. Panel participation is assumed to be *ignorable* with respect to the variables measured by survey conditional upon the variables used for matching. What this means is that if we examined panel participants and non-participants who have exactly the same values of the matching variables, then on average there would be no difference between how these sets of respondents answered the survey. This does *not* imply that panel participants and non-participants are identical, but only that the differences are captured by the variables used for matching. Since the set of data used for matching is quite extensive, this is, in most cases, a plausible assumption.

Assumption 2: Smoothness. The expected value of the survey items given the variables used for matching is a "smooth" function. Smoothness is a technical term meaning that the function is continuously differentiable with bounded first derivative. In practice, this means that that the expected value function doesn't have any kinks or jumps.

Assumption 3: Common Support. The variables used for matching need to have a distribution that covers the same range of values for panelists and non-panelists. More precisely, the probability distribution of the matching variables must be bounded away from zero for panelists on the range of values (known as the "support") taken by the non-panelists. In practice, this excludes attempts to match on variables for which there are no possible matches within the panel. For instance, it would be impossible to match on computer usage because there are no panelists without some experience using computers.

Under Assumptions 1-3, it can be shown that if the panel is sufficiently large, then the matched sample provides consistent estimates for survey measurements. The sampling variances will depend upon how close the matches are if the number of variables used for matching is large. In this study, over 150,000 respondents to PollingPoint Internet surveys were used for the pool from which to construct the matches for the final sample.

Sampling frame and target sample

YouGov/Polimetrix constructed a sampling frame of U.S. Citizens from the 2008 American Community Survey, including data on age, race, gender, education, marital status, number of children under 18, family income, employment status, citizenship, state, and metropolitan area. The frame was constructed by stratified sampling from the full 2008 ACS sample with selection within strata by weighted sampling with replacements (using the person weights on the public use file). Data on reported 2008 voter registration and turnout from the November 2008 Current Population Survey was matched to this frame using a weighted Euclidean distance metric. Data on religion, church attendance, born again or evangelical status, news interest, party identification and ideology was matched from the 2007 Pew U.S. Religious Landscape Survey. The target sample was selected by stratification by age, race, gender, education, and by simple random sampling within strata.

Stratification and matching

The sample drawn for the CCES were chosen from the YouGov/Polimetrix PollingPoint Panel and the E-Rewards and Western Wats panels using a five-way cross-classification (age x gender x race x education x state). All respondents who completed the pre-election survey were re-invited to the post-election survey. The final set of completed pre-election interviews were then matched to the target frame, using a weighted Euclidean distances metric.

The following distance function was used for the match:

```
fmatch <- function(target, pool) {
  1.5*(abs(target$gender - pool$gender)) +
    (abs(target$age - pool$age)/30) +
    0.5*(target$age3b - pool$age3b) +
    10*(target$race4 != pool$race4) +
    (target$region != pool$region) +
    (abs(target$educyrs - pool$educyrs)/6) +
    0.5 * (target$newsint != pool$newsint) +
    (mat.marstat5.marstat5[target$marstat5,pool$marstat5]/4) +
    1.5 *(target$pid5 != pool$pid5) +
    (target$ideo5x != pool$ideo5x) +
    (target$majrelg != pool$majrelg)/2 +
    (mat.churatd.churatd[target$churatd8,pool$churatd8]/10) +
    (mat.income.income[target$income,pool$income]/15) +
    4*(mat.votereg.votereg[target$votereg,pool$votereg]) +
    (mat.cbsa3.cbsa3[target$cbsa3,pool$cbsa3]/2)
}
```

Where the matching variables were:

- Gender: respondent's gender

- Age: respondent's age in years

- Age3b: categorical age variable with categories 18-29, 30-64, and 65+

- Race4: categorical race variable with categories white, black, Hispanic/Latino, and other

- Region: Census region

- Educyrs: years of education

- Newsint: interest in politics

- Marstat5: marital status

- Pid5: party identification with categories, Democrat, Independent leaning Democrat, Independent, Independent leaning Republican, Republican, and other

- Ideo5x: 5-point ideology

- Majrelg: Pew religion recoded into the following categories: evangelical protestants, mainline protestants, black protestants, Catholics, other Christians, other faiths, and unaffiliated

- Churatd: 6-point church attendance

- Income: household/family income

- Votereg: voter registration status

- Cbsa3: metropolitan statistical area (metro or non-metro)

For unordered variables, matrices of distances were used, as indicated above.

Weighting

The matched cases were then weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, years of education, gender, and turnout. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles. The final weights were then post-stratified by gender, race, education, and age. Weights larger than 7 were trimmed and the final weights normalized to equal sample size.

By sample matching on registered and unregistered voters we can create a nationally representative sample of US adults using appropriate sample weights. Approximately three fourths of US adults are registered to vote. In midterm elections approximately half of registered adults vote. Surveys tend to experience over reporting of voting behavior. The American National Election Study surveys for 2004 and 2002 report that approximately 78.5% of respondents said they voted in the 2004 general election, and 71.5% said they voted in the 2002 midterm election. Actual turnout numbers were in the range of 53% in 2004 and 42% in 2002. In the 2010 CCES 62.6% report voting (after weighting and accounting for non-voter dropoff between waves) and 87.0% report being registered to vote in the pre-election survey.

Validation

The very large sample of the CCES provides a way to validate the sampling by comparing the state level samples within the survey with the actual election results.

CCES 2012

Comparison of the CCES with actual election results provides internal checks on the quality of the sample and responses. Specifically, we can aggregate (using the weights V103 in the 2012 study) to the state level questions on vote for President (2012 CC410a), Governor

Table 3: Survey Accuracy in 2012 CCES Sample for Statewide Offices

Office	Avg. Error (DEM Bias)	Root MSE (St. Error)	Avg. Freq (Responses)	Expected St. Error (Avg. Sample)
President	2.16%	3.32%	1069	1.53
Governor	1.49%	3.56%	666	1.94
US SEN	2.27%	3.66%	1217	1.43
Atty Gen	-5.64%	16.86%	828	1.74
Secty of State	-5.05%	9.93%	844	1.72

(2012 CC411), U.S. Senator (2012 CC410b), and other statewide offices (2012 CC413a and CC413b).

The difference between the Democratic Percent of the Two Party vote for each office in the sample and the actual results measures the error. That error is due to sampling and to bias. The simple difference is the Democratic party bias, the squared error is the mean squared error, and the square root of the MSE is a measure of the standard error. The average (across states) MSE, Root MSE, and Democratic Bias for each office are shown in Table 3. The overall relationship between Democratic Share of the Actual Vote and Democratic Share of the Survey Reported Vote is shown in the Figures 1-5.

The square root of the Mean Squared Error is an alternative estimate of the standard error. The usual estimate assumes that the only source of error comes from random sampling. The variance of the error across surveys (in this case states) includes possible measurement error, such as that caused by question wording, and sample biases, caused by non-response or misreporting.

Due to small sample sizes per individual congressional district, we caution against analysis at the individual congressional district level. Table 4 reports the same information for individual congressional districts as Table 3 reported for statewide elections. Figure 6 visually demonstrates the relationship. Congressional district sample sizes are presented in Table 16 in Part IV of this guide. The survey overstates the average district's vote margin for the Democratic candidate by 2 points. The bias is within sampling error. The Total Survey Error exceeds what variation one would expect just from sampling, as the Root MSE is roughly double the Expected Standard Error.

Table 4: Survey Accuracy in 2012 CCES Sample for Congressional Districts

Office	Avg. Error (DEM Bias)	Root MSE (St. Error)	Avg. Freq (Responses)	Expected St. Error (Avg. Sample)
House	2.46%	10.01%	125	4.47
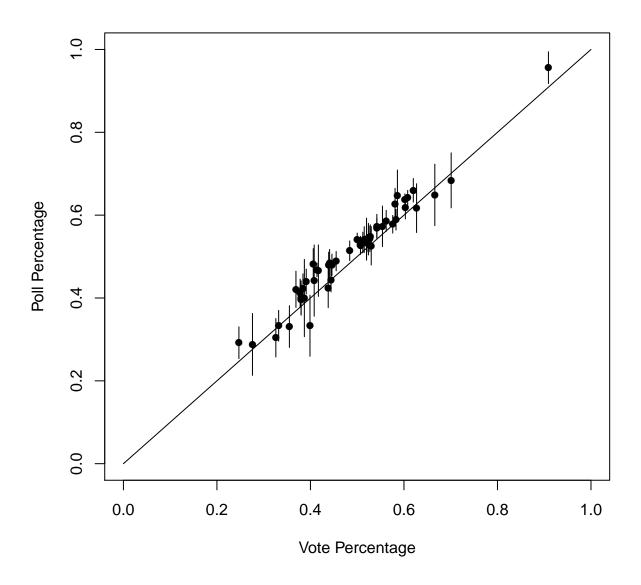

Figure 1: Presidential Vote Accuracy Plot, 2012
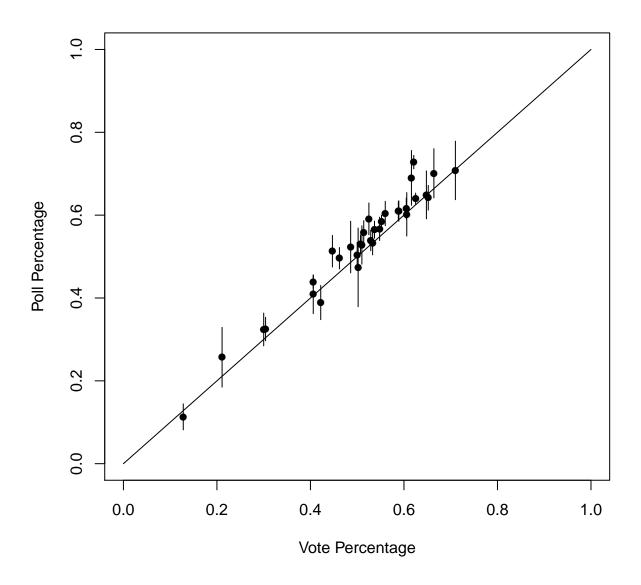

Figure 2: Senate Vote Accuracy Plot, 2012
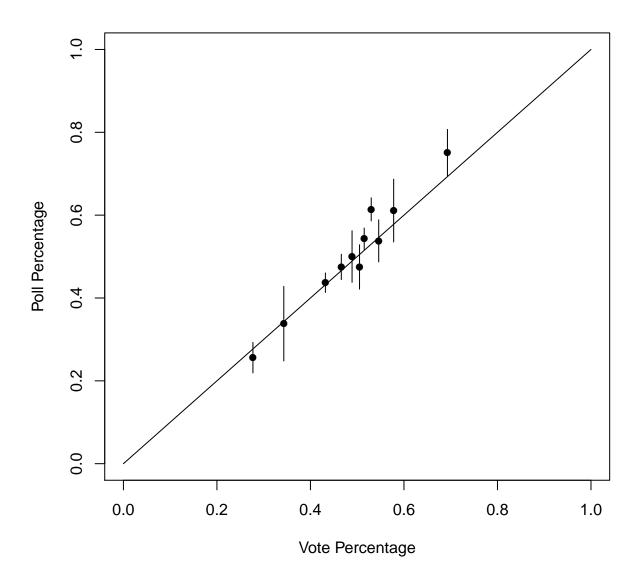

Figure 3: Gubernatorial Vote Accuracy Plot, 2012
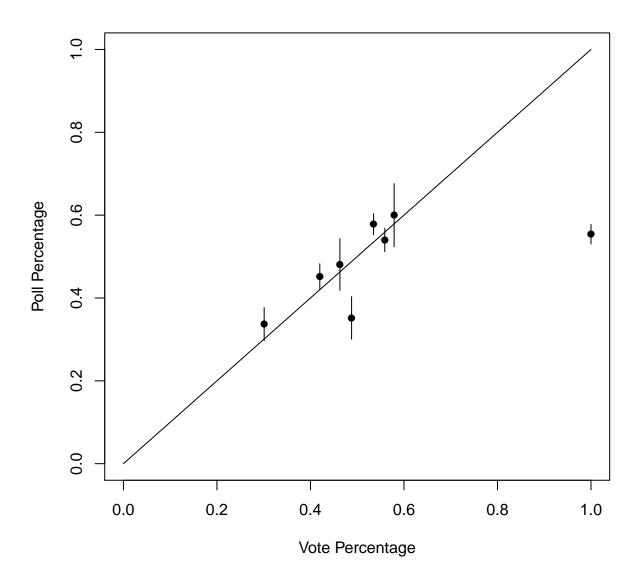

Figure 4: Attorney General Vote Accuracy Plot, 2012
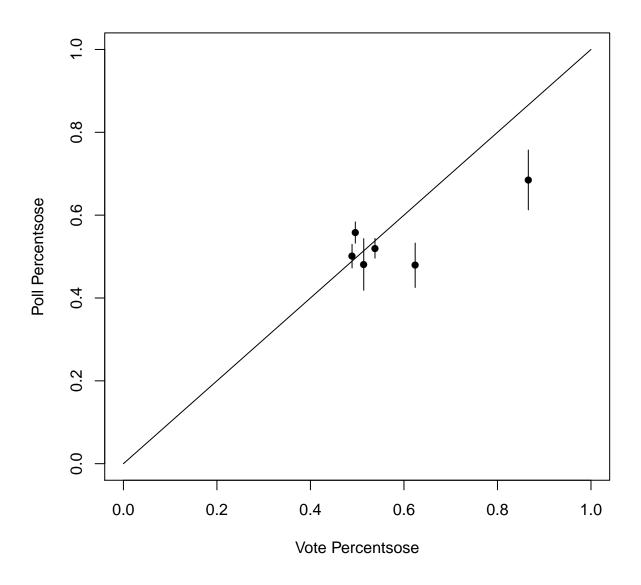

Figure 5: Secretary of State Vote Accuracy Plot, 2012
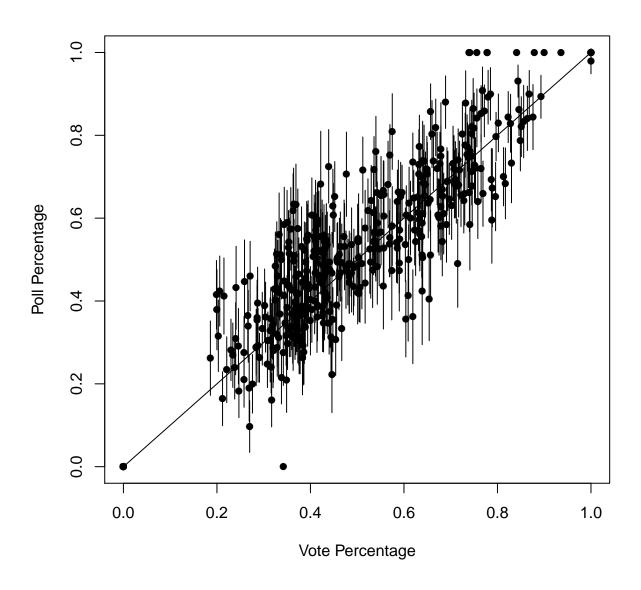

Figure 6: House Vote Accuracy Plot, 2012

CCES 2010

Table 5: Survey Accuracy in 2010 CCES Sample for Statewide Offices in states with at least 200 cases.

Office	Avg. Error (DEM Bias)	Root MSE (St. Error)	Avg. Freq (Responses)	Expected St. Error (Avg. Sample)
Governor	-0.95%	2.22%	9824	1.93
US SEN	-0.50%	1.30%	882	1.98
Atty Gen	-2.57%	5.04%	1802	2.00
Secty of State	-1.80%	4.49%	859	2.00
Overall	-1.34%	3.40%	950	1.94

The average (across states) MSE, Root MSE, and Democratic Bias for each office are shown in Table 5. The sample bias for vote choice is quite small. The average error across all offices equals -1.34%. For all offices, there is a small Republican bias. The largest bias occurs with Attorney General, where the survey understated the Democratic vote share on average 2.57%.

CCES 2008

Table 6: Survey Accuracy in 2008 CCES Sample for Vote Choice President, U. S. Senators, and Governors

Office	Average Standardized Error (Democratic Bias)	S.D. Standardized Error	Standardized RMSE
President	0.269	0.926	0.964
US Senator	0.003	1.256	1.256
Governor	0.320	0.816	0.876

The average (across states) MSE, Root MSE, and Democratic Bias for each office are shown in Table 6.

CCES 2006

The average (across states) MSE, Root MSE, and Democratic Bias for each office are shown in Table 7. The average error across all offices equals 0.3%. For some offices, there is a small Democratic bias, for others there is a small Republican bias. The largest bias occurs with Lieutenant Governors, where the survey overstated the Democratic vote share on average 2.4%.

Table 7: Survey Accuracy in 2006 CCES Sample for U. S. Senators, Governors, and Other Statewide Offices, in states with at least 200 cases.

Office	Avg. Error (DEM Bias)	Root MSE (St. Error)	Avg. Freq. (Responses)	Expected St. Error (Avg. Sample)
Governor	-0.04%	2.24%	604	2.53
US SEN	0.28%	4.29%	689	2.42
LT Gov	2.41%	4.58%	482	2.80
Atty Gen	-0.06%	4.31%	502	2.71
Scty of State	1.58%	4.36%	467	2.80
Treasurer	-0.39%	3.87%	465	2.79
Overall	0.30%	4.02%	561	2.64

Part III

Common Content

This section presents variables designed for the 2012 CCES Common Content. The 2012 survey consists of six types of variables. First, sample identifiers include region, state, county, congressional district, zip code, and designated market area (DMA). Second, Profile Questions consist of background data on individual respondents collected before the fielding of the survey, and include most demographics as well as indicators of party identification and ideological orientation. Unless otherwise noted, Profile Questions were administered prior to the fielding of the Pre-Election survey. Third, Pre-Election Questions were asked in the pre-election wave in October. They are denoted CC3xx. Fourth, Post Election Questions were asked over the two weeks immediately after the election. They are denoted CC4xx. Fifth, the survey is linked to contextual information about representatives, candidates, and elections. Most of these contextual variables are contained in separate files (to conserve memory) and will be available at the CCES website.

The remainder of this guide presents the sections of the survey in the order in which the variables occur in the dataset.

Sample identifiers

V101   Case Identifier

V103   Common Content Weight

Number of Valid Observations: 54535
Mean: 1
Standard Deviation: 1.31757
Minimum: 0.00001
Maximum: 20.00044

inputzip   Pre Election Survey Respondent Zip Code

So that we can ask you about the news and events in your area, in what zip code do you
currently reside?
Require integer value between 501 and 99999.

inputstate   Pre Election State Name

See Table 2 on page 9 for state numeric values (FIPS) and frequency counts.

cdid   Pre Election Congressional District Number, 112th Congress

cdid113   Pre Election Congressional District Number, 113th Congress

countyfips   Pre Election County FIPS Code

countyname   Pre Election County Name

inputstate_post   Post Election State Name

cdid_post   Post Election Congressional District Number, 112th Congress

cdid113_post   Post Election Congressional District Number, 113th Congress

countyfips_post   Post Election County FIPS Code

countyname_post   Post Election County Name

Profile survey

birthyr   Birth Year

In what year were you born?
Require integer value between 1900 and 2000.

0	9998	Skipped

CC415r   Taxes vs. Spending

If your state were to have a budget deficit this year it would have to raise taxes on income and sales or cut spending, such as on education, health care, welfare, and road construction. What would you prefer more, raising taxes or cutting spending? Choose a point along the scale from 100% tax increases (and no spending cuts) to 100% spending cuts (and no tax increases). The point in the middle means that the budget should be balanced with equal amounts of spending cuts and tax increases. If you are not sure, or don't know, please check the 'not sure' box.

0=All from tax increases
100=All from spending cuts

23730	0-100	Reported Values

8714	998	Skipped
11592		NA's

CC416r   Income vs. Sales Taxes

If the state had to raise taxes, what share of the tax increase should come from increased income taxes and what share from increased sales taxes? Choose a point along the scale from 100% from sales (and none from income) to 100% from income (and none from sales). The point in the middle means that any increase in taxes should come equally from sales and income taxes. If you are not sure, or don't know, please check the 'not sure' box.

0=All from sales taxes
100=All from income taxes

Part IV

Contextual Variables

Contextual variables consist of the names and parties of the candidates for U. S. House, U. S. Senate, and Governor. For all offices, Candidate 1 is the Democrat and Candidate 2 is the Republican, except when no Democrat is running. When no Democrat is running, the Republican is listed as Candidate 1. When only one candidate is running, Candidate 2 is listed as "NA".

Senate

Table 10: United States Senate, 112th Congress

State	N	CurrentSen1	CurrentSen2
Alabama	749	Jeff Sessions (R)	Richard C. Shelby (R)
Alaska	128	Mark Begich (D)	Lisa Murkowski (R)
Arizona	1437	Jon Kyl (R)	John McCain (R)
Arkansas	488	Mark L. Pryor (D)	John Boozman (R)
California	5059	Dianne Feinstein (D)	Barbara Boxer (D)
Colorado	983	Mark Udall (D)	Michael F. Bennet (D)
